

SriMaitreyi | Post-Deployment Regression Testing (1-Pager)

Purpose: Verify frontend + backend after each deploy before go-live. P0 fail = No-Go / rollback.

1. How to start (process for every deployment)

1) Record build: backend image tag (e.g. v61), frontend commit/branch, change summary. 2) Target env: staging preferred; else named Regression Patient on prod (no clinical decisions). 3) Baseline smoke: GET /health OK, frontend loads, login works. 4) Run P0 checklist (~20-40 min), then P1 if area touched. 5) Fill sign-off box below; any P0 fail = No-Go.

2. P0 - Backend (must pass)

- | | |
|--|---|
| ☐ GET /health returns ok; pods Ready | ☐ New session allowed after prior completed |
| ☐ Auth /login works for roles in use | ☐ Medical report PDF (summary + detailed) 200 |
| ☐ Patients list / overview returns data | ☐ Report charts: all-history + albumin present |
| ☐ POST /sessions/start with target dry weight | ☐ Nutrition / fluid / CBP APIs read-write OK |
| ☐ POST /sessions/{id}/end with post weight only | ☐ No 500s on open-session, sessions, trends |
| ☐ Session status = completed (no Post-K gate) | ☐ Startup migrations / logs clean |

3. P0 - Frontend (must pass)

- | | |
|---|---|
| ☐ Login -> correct home (patient/staff/admin) | ☐ Diaries: nutrition (multi-food), fluid, meds |
| ☐ Dashboard tiles load; Report comparison opens | ☐ Report download + PDF preview opens |
| ☐ Start session: only Target dry weight required | ☐ Charts readable; legends/colors clear |
| ☐ End dialysis: only Post weight required | ☐ Report comparison: Kcal/Protein/K + BP |
| ☐ Badge shows Completed (not Awaiting Post K) | ☐ Staff can open patient routes by id |
| ☐ Session list / detail / edit assessments | ☐ No blank screens / console API failures |

4. P1 - Run when change touches area (or weekly)

Nutrition multi-select & totals | CBP pre/post urea -> URR on PDF | Vaccine/allergy/health history | AI ask endpoint | Admin add patient | Attachments upload | Interdialytic fluids vs IDWG in report | Neo4j /health/neo4j if graph enabled.

5. Suggested regression patient & role coverage

Keep one Regression Patient with: >=3 sessions (weight, BP, UF, pre K), >=2 nutrition days, >=1 CBP (pre/post urea + albumin). Roles: Patient (dashboard/diaries/report), Technician (start/end session), Doctor (review + PDF), Admin (overview). Timebox: P0 20-40 min; P0+P1 1-2 hrs.

6. When to expand

Session/mandatory-field changes -> full start-end-new path. PDF/chart changes -> short+detailed PDF + empty-data patient. Auth changes -> all roles. DB/migrations -> list patients/sessions after restart. FE-only UI -> P0 UI + one save round-trip.

7. Sign-off (present to lead)

Date: _____ Env: Staging / Prod-test patient Tester: _____
Backend image/tag: _____ Frontend branch/commit: _____
Change summary: _____

P0 Backend: Pass ☐ Fail ☐ P0 Frontend: Pass ☐ Fail ☐ P1: Pass ☐ Fail ☐ N/A ☐
Blockers: _____

Decision: GO ☐ NO-GO / ROLLBACK ☐
